My P2b–F occasionally(once every summer) lost keyboard and mouse detection, the only thing that i do is reset the CMOS, wait 2 to 3 hour and take out every componets and reset it. Then the mobo is good again.

I had the keyboard problem when I got the Board. A bigger amount of contact–spray fixed it, till now (heavy used PS/2 Socket). Now I have met the problem again, missing Keyboard. But this time the prob is on the other end of the cable. :-)

Maybe you have bad power supply(if both of them are the same brand and model, then it is possible that they fail in the same way and time. I saw it last year that 2 aopen power supply( same model, same Date of manufacture)died almost at the same time. and it turns out they have couple of leaking capacitors.

Yes, good hint.
