I have a fiberglass shower stall and when it is used, water splashes off of who ever is using it and wets the first 4-6 inches of wall at the top of the shower stall. This of course has eventually caused the paint and what ever else the builder used to crack. What are my options? I figure worse case, I can cut out the first foot or so up of drywall/greenboard replace and tile. Is there any type of mud or paint I could use to seal the wall?
