I use this function for a job like you have:

Record is the string

Field is the delimiter, a comma in your case

VeldNr is the count of the field you want to isolate

```
Attribute VB_Name = "IsolateField"
```

```
Option Explicit
```

```
Public Function GetField(Record As String, Field As String, VeldNr As Integer) As String
```

```
'Isolate a field from a string
```

```
On Error GoTo FaultHandler
```

```
GetField = Split(Split(Record, Field)(VeldNr), ",")(0)
```

```
Exit Function
```

```
FaultHandler:
```

```
Select Case Err.Number
```

```
Case 9
```

```
Err.Clear
```

```
Exit Function
```

```
Case Err.Number
```

```
MsgBox "Fault in GetField Module: " + Str(Err.Number) + Chr$(13) + Chr$(10) + Chr$(10) + Error + " !",  
vbExclamation + vbOKOnly
```

```
Err.Clear
```

```
End Select
```

```
End Function
```

Thanks for previous assistance, I have now managed to install this on Vista

I have a string in VB that contains lots of dats seprated by commas

I am trying to think of a simple and easy method of extracting different values from this text string and placing them into variables.

Re: Comma seprated string

Any suggestions on how best to do this?

TIA

C
