I'm after a 6502 assembler for my Apples, and am hoping for some advice on the best one to choose. Although I realise it may not be possible for all my requirements to be met, here is what would be ideal:

Check out the S-C Assembler, available for download with full documentation at:

<http://www.stjarnhimlen.se/apple2/>

I believe these disks include the IIgs bug mentioned in an earlier post,
(<http://groups.google.com/group/comp.sys.apple2/msg/a480c0a4f9d071d8>)
and documented in the July 1987 issue of Assembly Lines.

<http://bobsc5.home.comcast.net/aal/1987/aal8707.html>

The 65816 processor interacts badly with ProDOS in using a buffer located in the zero-page.
