I would like to know about some useful text based news readers for Slackware Linux.

Thanks in advance for any help.

I have used slrn, nn, pine, tin and gnus. For someone new to text-based programs I would recommend tin or slrn.

You should be able to configure all the above programs to share the same newsrc file and this will allow you to switch between them and work out which you like best.

I love trying out new newsreaders. Have fun!
